

(TMI Focus, Vol. XXIV, No. 2 & 3, Spring/Summer 2002)

**QUARTERLY CD**  
*Purrfect Hemi-Sync®*

The second quarterly selection, *Purrfect Hemi-Sync*, was developed based on information from an article titled “Healing Purrs” in Cats Magazine. The article stated that research being conducted at the Fauna Communications Research Institute (FCRI) in North Carolina has found another possible reason why ill or injured cats purr. The sound frequency of a cat’s purr may help heal injuries.

Ronald Russell, a member of our Board of Advisors, also sent us an article published in the London Sunday Telegraph, March 18, 2001. This article states that the FCRI has found that “between 27 and 44 hertz (a measure of the number of cycles per second) [is] the dominant frequency for a house cat. . . . This reinforces studies confirming that exposure to frequencies of 20-50Hz strengthens human bones and helps them to grow.”

We hope you enjoy this exercise. Please return the questionnaire at your convenience.
